Tadalafil by itself is effective for the treatment of LUTS/BPH, and combination therapy with finasteride provides additional benefit by improving both peak urinary flow rate and PVR. The combination therapy group showed a greater reduction in PVR compared to the tadalafil monotherapy group. These results suggest that combination therapy may be a suitable option for patients with more severe LUTS/BPH who have not responded adequately to monotherapy with tadalafil or finasteride.
Combination therapy was better than zidovudine alone for HIV infection
