EBM notebook

98 Jottings ...

98 Knowledge-to-action cycle

101 Evidence-based medicine targets the individual patient, part 1: how clinicians can use study results to determine optimal individual care

102 "Self testing but not self managing"

102 Response

102 Dare to be RISCY!

Evidently

103

Therapeutics

104  Telling smokers their "lung age" promoted successful smoking cessation

105 Review: cranberry products may prevent urinary tract infection in women with recurrent infections

106 Honey, not dextromethorphan, was better than no treatment for nocturnal cough in children with upper respiratory infections

107 Altering the glycaemic index or carbohydrate intake did not affect glycaemic control in type 2 diabetes

108 Adjustable gastric banding plus conventional therapy improved glycaemic control in obese patients with type 2 diabetes

109 A personalised intervention reduced weight regain in overweight and obese adults who had recently lost weight

110 Review: paroxetine and placebo do not differ for treatment discontinuation in major depression

111 Review: α -antagonists and calcium channel blockers both improve spontaneous expulsion of kidney stones

112 Review: reduction in resting heart rate after taking β -blockers or calcium channel blockers reduce mortality and morbidity after MI

113 Review: statins prevent stroke and reduce mortality

114 Dexamethasone and placebo did not differ for respiratory status change or hospital admission in infants with acute bronchiolitis

115 Review: azathioprine, infliximab, certolizumab, and adalimumab are effective for maintaining remission in Crohn's disease

116 Review: lack of evidence that multifactorial risk assessment and targeted interventions prevent falls in elderly people

117 CT pulmonary angiography was not inferior to ventilation—perfusion lung scanning for ruling out PE

Diagnosis

118 A rapid antibody test had high specificity but low sensitivity for diagnosing coeliac disease

119 Albumin:creatinine ratio using an automated analyzer was accurate for diagnosing proteinuria in pregnancy

Prognosis

120 Age, sex, and functional impairment predicted risk of mortality in incident dementia at 14 years

Aetiology

121 Young women's risk of first HPV infection was high and increased when the first male partner was sexually experienced

Quality improvement

122 Review: symptom-based action plans reduce acute care visits more than peak flow-based plans in children with asthma

Clinical prediction guide

123 QRISK underestimated risk of CVD in general practice patients; the Framingham score overestimated risk

Resource reviews
