### Editorial
- 34 US healthcare reform and the evidence gap: the need for high-quality research in paediatric preventive care

### Perspective
- 36 Consensus abstracts for evidence-based medicine

### Therapeutics
- 39 For type 2 diabetes poorly controlled by metformin monotherapy, the addition of any non-insulin antidiabetic drug reduces HbA1c to a similar extent, but with differing effects on weight and hypoglycaemic risk
- 40 Calcium supplementation during pregnancy reduces risk of high blood pressure, pre-eclampsia and premature birth compared with placebo?
- 42 The additional value of self-monitoring of blood glucose in patients with type 2 diabetes not using insulin is 'not proven'
- 43 Supervised exercise therapy provided by local physiotherapists improves walking distance in patients with claudication
- 44 Early initiation of dialysis in patients with chronic progressive kidney failure does not confer a mortality advantage when compared with an approach of late initiation combined with appearance of symptoms or signs of ureaemia
- 45 Fenofibrate and statin therapy, compared with placebo and statin, slows the development of retinopathy in type 2 diabetes patients of 10 years duration: the ACCORD study
- 46 Sensor-augmented insulin pump more effective than multiple daily insulin injections for reducing HbA1c in people with poorly controlled type 1 diabetes
- 48 Compared with placebo, trimethoprim–sulfamethoxazole does not reduce rates of treatment failure after drainage of uncomplicated skin abscesses, but reduces the occurrence of new lesions in the following 30 days

### Diagnosis
- 57 Universal newborn hearing screening improves quality of life in children aged 3–5 years but does not show a clear relationship with spoken language skills

### Prognosis
- 59 Daytime births are associated with better perinatal outcomes in secondary and tertiary hospitals
- 60 Migraine with aura – indication of an increased risk of hemorrhagic stroke in women (Women’s Health Study) and increased risk of overall death in an Icelandic population (Reykjavik Study)

### Prevalence
- 63 Prevalence of hypertension is about 1–2% in African American girls and 0.5% in Caucasian girls aged 9 or 10 years, and prevalence increased with obesity
